

# VX series: All-round pumps for tank trucks

## Case Study - Franz Fischer Spedition GmbH

### Problem

The wide range of media compositions in the chemicals industry

### Solution

Vogelsang VX136-140Q rotary lobe pump

### The customer and the problem

Tank trucks for transporting liquids from the chemicals industry are faced with particularly difficult tasks. The medium must often be extracted and pumped to the vehicle tank, and then from the vehicle tank to the storehouse at the destination. The chemical composition of these media often cannot be predicted precisely beforehand. And there is limited space for installing a pump. In spite of this, charging and discharging should be as fast as possible.

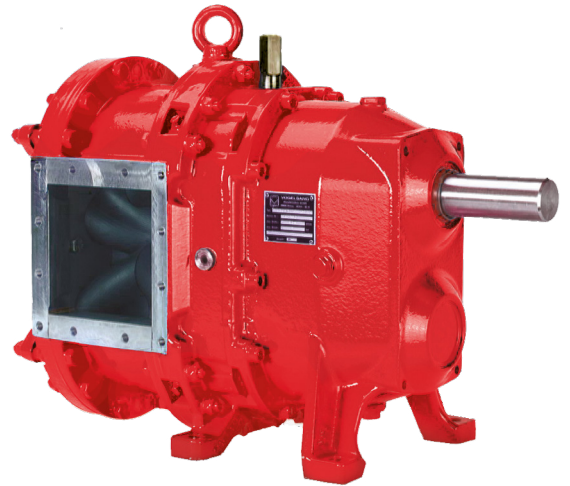

### The solution

Vogelsang rotary lobe pumps are a proven solution. Driven by a hydraulic motor which is mortised into the drive shaft, they impress with extremely compact dimensions and a high pump flow (up to over 70m<sup>3</sup>/h in specific cases). The pump direction can easily be changed by changing the direction of rotation. Self-priming and high pressure are no problem.

All parts which come in contact with the media are made of stainless steel to protect the system against often extreme corrosiveness. The lobes are coated with Viton due to its excellent resistance to many chemicals. Should there be a serious - case of corrosion due to the unpredictability of the medium, the QuickService design means that the lobes and even the mechanical seal can be replaced in no time at all.

Transporting chemicals economically: no problem with Vogelsang technology.

Vogelsang VX136

### Advantages of the VX and IQ series

- Compact design with high pump capacity
- Self-priming and variable pump direction
- QuickService design makes it extremely easy to service and maintain
